

MOBILE SECURITY Armoured Cars

Tecnove Security provides security solutions to companies and individuals in a world where personal security requires the latest advances in materials and electronics in order to guarantee the safety of occupants.

Tecnove Security technology can be used to armour any type of vehicle - saloon cars, vans and SUVs (Sports Utility Vehicles) – but always respecting the exterior appearance so that the armour-plating passes unnoticed.

The transformations performed on these cars comply with and exceed all national and international legal requirements, in terms of both armour-plating and electronic security systems.

All vehicles are delivered with the pertinent authorisation documents and certificates: technical project, material homologation reports, regulation stamps from authorized laboratories and test drive reports.

The vehicles can be armoured to varying degrees in accordance with European classification standards, conserving the original properties of a top-of-the-range vehicle and adapting the entire armoured system to the needs of the client.

Key points of the mechanics and chassis of vehicles are reinforced and modified, ensuring the perfect functioning of the vehicle on the road. For this reason vehicle models chosen possess the horsepower needed so that the performance is not hindered by the extra weight of the armoured-plating.

Configuration

- GPS-GPRS system.
- Acoustic and luminous alarm.
- Automatic fire detector and extinguisher, engine - undercarriage - wheels.
- Anti-puncture tyres.
- Independent ventilation system.
- Anti-gas masks.
- Tinted windows.
- Intercom.
- Gas extraction from inside the vehicle.
- Public address system.
- Map reader.
- Electric bullet-proof windows.
- Anti-grenade floor.
